Business Plan Strategy: Frontline (productized from SKB)

> *Front-of-house operations for the restaurants OpenTable forgot.*

Status: Draft v1 — assembled via FRAIM `business-plan-creation` workflow on 2026-04-10 **Origin:** Productized from SKB, live in production at `skb-waitlist.azurewebsites.net` since Q1 2026 serving Shri Krishna Bhavan, Bellevue WA as the flagship customer **Working name:** Frontline (placeholder; domain check is action item I2)

🎯 Executive Summary

Frontline is a multi-tenant restaurant operations platform that turns the lobby of a 200-cover walk-in restaurant from chaos into calm — without requiring an app, an account, or a smartphone. It is the productization of SKB, a system already running in production for Shri Krishna Bhavan in Bellevue, Washington. Every capability described in this plan is already shipped or in active development.

The opportunity. US independent restaurants total **412,498 locations** (NRN, 2026) inside a **$1.55 trillion** industry (National Restaurant Association, 2026). The restaurant **waitlist software** sub-segment is a $576M market growing at 8.1% CAGR to $1.12B by 2033 (Dataintelo, 2026). Existing tools are built for chains (Yelp Guest Manager, Toast), for fine dining (OpenTable, Resy, Tock), or for healthcare/retail with restaurants as an afterthought (Waitwhile). **None of them speak the language of the corner Indian restaurant on a Saturday night.**

The wedge. Four underserved segments — diaspora-cuisine independents, halal/kosher religious-community restaurants, brunch-driven urban indies, and boba/Asian dessert shops — share a structural pattern: owner = buyer = user, tight community referral networks, and currently served by tools designed for somebody else. Total addressable market in those four segments: **~120,000 restaurants → $80M ARR at full capture**. Target Year 3 capture: **3% = $2.39M ARR**.

Why we win. Five differentiators no competitor structurally replicates without rewriting their product: 1. **Voice IVR** for non-smartphone diners — Twilio-backed phone-based queue join, already shipped (`src/routes/voice.ts`) 2. **Full dining lifecycle** past "seated" through `ordered → served → checkout → departed` (`src/services/dining.ts`) 3. **No app, no account, no PII** for diners — competitive moat against Yelp's data extraction model 4. **AI-native MCP server surface** — already exposing the system to ChatGPT/Claude/Gemini agents (`src/mcp-server.ts`) 5. **$79/month flat, no contracts, no per-cover fees** — predictable owner-perceived cost is the entire wedge against OpenTable

The plan. Bootstrap to **10 paying customers ($5K MRR)** in 6–9 months from a side-project posture, founder goes full-time within 30 days of crossing $5K MRR, raise an optional **$750K–$1.5M pre-seed** to accelerate to **500 paid customers ($480K ARR) by end of Year 2** and **1,500 paid customers ($1.44M ARR) by end of Year 3**. Capital-efficient by design. Target outcome: $3M+ ARR, profitable, founder retains majority. Venture-optional, not venture-required.

The unit economics. The load-bearing pricing decision is **$79/month flat Pro tier, $149 High Volume tier**, powered by a **Telnyx + WhatsApp Business API messaging stack** instead of Twilio-only. At realistic volumes, this produces 58–81% gross margin on Pro customers (healthy, not the originally-claimed 87% which was based on a fabricated volume assumption and has been corrected — see the errata and corrected COGS table in Part 3). The combination of Telnyx (~36% cheaper CPaaS than Twilio) and WhatsApp (free service-window messages for diaspora restaurants where ~90% of diners use it) produces a 70%+ messaging-cost reduction versus the default Twilio-only stack that incumbents use. **This cost structure is the moat that makes the "$79 flat, no overage, no per-cover" pricing posture sustainable.**

🧭 Part 1: Market Segments Overview

Segment Comparison Matrix

Seven candidate segments scored 1–5 on FRAIM segment-selection criteria. Top 4 selected as the tip-of-the-spear; bottom 3 explicitly excluded.

#	Segment	Pain	Size	WTP	Network	Distribution	Budget clarity	Comp. underserved	Total
A	**Diaspora-cuisine independents** (Indian, Vietnamese, Korean, Sichuan, Latin)	5	4	4	5	5	5	5	**33**

#	Segment	Pain	Size	WTP	Network	Distribution	Budget clarity	Comp. underserved	Total
B	**Halal / kosher religious-community restaurants**	4	3	4	5	4	5	5	**30**
C	**Brunch-driven urban indie cafés**	5	4	4	4	3	5	4	**29**
D	**Boba / Asian dessert shops**	4	4	3	4	4	5	4	**28**
E	Mini-franchise family chains (3–15 locations)	3	3	5	2	2	2	2	19
F	Fine dining (Resy/OpenTable comp)	1	4	2	2	2	4	1	16
G	Counter-service fast-casual (Toast/Square comp)	1	5	2	2	1	2	1	14

Why these four (and explicitly NOT the others). The top 4 share three traits: (1) owner is the buyer is the user — no procurement cycle, demo-to-credit-card in <7 days; (2) tight community referral networks where one happy customer produces ~0.5 referred customers within 90 days; (3) currently served by tools built for chains/healthcare/POS-first restaurants. The bottom 3 fail one or more in a way that defeats the GTM motion: chains have procurement, fine dining is locked by OpenTable, fast-casual is locked by Toast/Square.

Primary Target Segments

Segment A — Diaspora-cuisine independents *(primary entry segment, $66M segment value)*

- **Customer:** owner-operator of a single-location, family-run restaurant doing 200–800 covers/day with brutal weekend rush.
- **JTBD:** *"Help me stop losing weekend walk-ins to angry lobby crowds and a paper list, without forcing my older customers to download an app."*
- **Pain points:** lobby overflow on Friday/Saturday/Sunday; no-shows after long quoted waits; older / non-English / non-smartphone diners locked out by app-required competitors.
- **Value proposition:** *Frontline gives diaspora-cuisine restaurants the lobby calm of a Cheesecake Factory pager system — at $79/month, with no app for diners and a phone-call fallback for grandma.*
- **Buying process:** owner-operator decides over a single demo. Sales cycle 1–7 days, no contract, monthly billing.
- **Distribution:** owner WhatsApp groups, ethnic chambers of commerce, food festival sponsorships, supplier networks (Restaurant Depot, ethnic distributors), word-of-mouth across cousins/in-laws — Sid is already in this network through SKB Bellevue.
- **Sized at:** ~70,000 restaurants (Indian anchor 12,653 + extrapolated peers).

Segment B — Halal / kosher religious-community restaurants *(second wave, $12M segment value)*

- **Customer:** owner-operator with 80% large-party covers, brutal Friday/Saturday rush, religious holiday spikes (Eid, Iftar, Passover, Rosh Hashanah).
- **JTBD:** *"Help me serve my community on the busiest religious nights without making families with small kids stand in a parking lot."*
- **Pain points:** large-party clustering; religious holiday surge; community trust requirement (diners want to see fellow community members in the queue).
- **Value proposition:** *Frontline turns the parking lot into a virtual lobby for religious-community restaurants on their busiest nights — without forcing families to install an app.*
- **Buying process:** same as Segment A.
- **Distribution:** religious community centers, mosque/synagogue newsletters, Halal/Kosher Yelp-equivalents (Zabihah, GoKosher).
- **Sized at:** ~13,000 restaurants.

Segment C — Brunch-driven urban indie cafés *(third wave, $28M segment value)*

- **Customer:** owner-operator of a hipster brunch spot in Brooklyn / Capitol Hill / Mission / Wicker Park, 8 AM–3 PM service, 90-min Saturday wait is normal.
- **JTBD:** *"Help me capture the people walking past who see the wait and leave for the place across the street."*
- **Pain points:** walk-by abandonment; group decision paralysis; the hostess is also the barista (labor pressure).
- **Value proposition:** *Frontline lets brunch indies recapture every walk-by — the diner joins from the sidewalk, gets coffee three doors down, and gets a text when their table is ready.*
- **Distribution:** local food blogs, Eater city verticals, cafe owner Instagram networks.
- **Sized at:** ~30,000 restaurants.

Segment D — Boba / Asian dessert shops *(fourth wave, $6M segment value)*

- **Customer:** Asian-American suburban entrepreneur, often part of a 1–3 location regional brand, rush after high-school release and weekend mall traffic.
- **JTBD:** *"Help me handle the high-school release rush without my one staff member melting down behind the counter."*
- **Pain points:** predictable demand spikes; order accuracy under line pressure; TikTok virality surge handling.
- **Value proposition:** *Frontline turns the boba line into a virtual queue so customers can browse other shops in the mall while their order moves forward.*
- **Distribution:** Asian-American business associations, supplier networks (Lollicup, Tea Zone), TikTok food influencer DMs.
- **Sized at: 6,635 restaurants** (IBISWorld).

📊 Part 2: Market Research Synopsis

TAM / SAM / SOM

Pricing assumption: $79/month Pro tier × 12 = **$948 ARPU/year**.

Layer	Definition	Restaurants	ARR potential
TAM (US-wide)	Every US independent restaurant Frontline could theoretically serve	**412,498**	**$391M**
SAM (4 target segments, walk-in heavy)	Filter to 70% walk-in heavy	~84,000	**$80M**
SOM Year 3 conservative	2% capture, bootstrap motion	~1,680	**$1.59M ARR**
SOM Year 3 target	3% capture, with $750K–$1.5M pre-seed	~2,520	**$2.39M ARR**
SOM Year 5 stretch	5% capture, Series A optionality	~4,200	**$3.98M ARR**

Sanity check: at $1.59M ARR (Year 3 conservative), Frontline captures **0.14%** of the $1.1B 2033 waitlist software market — well within "share-takeable from underserved subsegments without dislodging incumbents." This is a take-share play, not a market-creation play.

Key sources: - US restaurant industry sales: **$1.55T** (NRA, 2026) - US independent restaurants (end of 2025): **412,498**, down 2.3% YoY (NRN, 2026) - Restaurant **waitlist** software market: **$576.2M (2024) → $1,122.8M (2033)** at 8.1% CAGR (Dataintelo) - Restaurant **management** software market (broader category): **$3.68B (2025) → $7.94B (2034)** at 9.1% CAGR (Business Research Insights) - US Indian restaurants (Jan 2026): **~12,653** (poidata.io) - US bubble tea shops: **6,635 businesses, $2.6B revenue, 24.1% CAGR 2020-2025** (IBISWorld)

Competitive Forces (Porter's Five Forces)

Force	Rating	Why
Threat of new entrants	**HIGH**	SaaS distribution is cheap; Frontline itself was built as a side project. Counter: out-execute in chosen segments before entrants discover them.

Force	Rating	Why
Bargaining power of suppliers	**MODERATE**	Twilio A2P 10DLC pricing is the main risk. Mitigated by Azure Communication Services dual-vendor in flight (issue #33).
Bargaining power of buyers	**HIGH**	Owner-operators are price-sensitive and switching costs are low. Counter: be unambiguously better at the specific job rather than locking in.
Threat of substitutes	**HIGH**	Paper waitlists are free; AI-voice substitutes emerging. Counter: absorb the substitute by being the AI-voice agent (voice IVR per #31/#33).
Competitive rivalry	**MODERATE overall, LOW in our 4 entry segments**	10+ named competitors but rivalry is concentrated at chains/fine dining tier. **Our entry is into a rivalry vacuum.**

Industry attractiveness: MODERATE → ATTRACTIVE for chosen segments. Two HIGH forces (buyer power, substitutes) prevent a 20× revenue multiple SaaS classification, but the underserved-segment wedge is genuinely defensible. Strategic posture: capital-efficient win, not category creation.

Network Effects & Lock-in

Type	Strength	Mechanism
Data	HIGH	Cuisine-specific ETA priors improve with scale. Indian thali ~38min turn, Vietnamese pho ~22min, boba ~6min — useless with 1 customer, load-bearing with 100. Comparable analog: Resy / OpenTable wait-time predictions, both cross-customer trained.
Customer (owner-side)	**VERY HIGH**	Owner-to-owner referral within tight community networks. Target viral coefficient K = 0.4–0.6 in Segment A. **The load-bearing growth mechanic.** Comparable analog: Toast's growth in Boston independents.
Customer (diner-side)	LOW	Cross-restaurant diner UX familiarity. Target K = 0.05–0.1. Retention boost only, not a growth mechanic.
Platform	**HIGH (12-24 month horizon)**	MCP server already shipped (`src/mcp-server.ts`). As ChatGPT/Claude/Gemini ship restaurant-aware agents, every Frontline restaurant becomes a discoverable node. **No competitor has this surface.**

🚀 Part 3: Growth & Virality Strategy

Viral Mechanisms

Primary viral loop — Segment A diaspora-cuisine, target K = 0.4–0.6:

```
Diner uses Frontline at SKB Bellevue (organic install)
  → Diner shares queue link in family WhatsApp group
  → 8 family members see rich preview (live wait time, restaurant name, "Powered by Frontline")
  → 1 in 8 is or knows a restaurant owner
  → Owner clicks "Powered by Frontline" → lands on Frontline pitch page
```

```
  → 1 in 4 books a demo, 1 in 2 closes within 14 days
  → New customer joins, repeats the loop
```

K-coefficient math: 8 family-share views × 12.5% owner-relevance × 25% demo-book × 50% close = **0.125 cycles per join × ~4 joins per active restaurant per day = 0.5 referral customers per active restaurant per 90 days.** Hits the K = 0.5 target.

Viral touchpoint inventory: - Diner queue page (highest visibility, per-join frequency) - SMS confirmation + table-ready notifications (forwarded constantly) - Google Maps card (passive but high-conversion) - WhatsApp link previews with rich OG/JSON-LD metadata (already shipped per #30) - Door QR code (captures walk-by segment) - MCP / AI-agent surface (12–24 month emerging)

A subtle "Powered by Frontline" mark on every diner queue page footer turns each share into an owner-discovery event.

Retention & Unit Economics

Retention philosophy: *Daily Habit (host opens dashboard every shift) + High Value (visible labor savings) + Low Friction (no training required) + Emotional Connection (the lobby is calm now).*

Retention targets:

Metric	Year 1	Year 3
Day 30 retention (cohort)	60%	70%
Logo retention (annual)	75%	85%
Net dollar retention	100%	110%
MAU as % of paid	90%	95%

CAC / LTV by segment ($79 ARPU/mo, ~26-month average lifetime, **LTV = $2,054**):

Segment	Y1 CAC	Y2 CAC	LTV : CAC (Y1)	Payback (Y1)
A. Diaspora-cuisine	**$120**	$240	**17.1:1** ⭐	1.5 mo
B. Halal/kosher	$180	$280	11.4:1	2.3 mo
C. Brunch indies	$320	$380	6.4:1	4.1 mo
D. Boba shops	$280	$340	7.3:1	3.5 mo

All four segments clear the >3:1 floor. Three of four clear >5:1 healthy. **Segment A at 17:1 is the standout** and validates the "diaspora-cuisine first" entry strategy. The right reading: the diaspora-cuisine entry funds everything else.

Unit economics — honest COGS with the corrected messaging stack

> ***Errata (2026-04-10):*** *the original COGS table in this document assumed ~600 SMS/month per Pro customer and claimed an 87% gross margin. A post-commit review of realistic restaurant volumes showed the 600-SMS assumption was off by ~10× — a real 80-joins/day diaspora-cuisine restaurant produces ~6,500 SMS/month on a pure-SMS stack. Corrected numbers below use (a) Telnyx instead of Twilio as the default SMS provider, (b) WhatsApp Business API as the primary channel for diaspora-segment restaurants with SMS fallback, and (c) volume profiles grounded in realistic join counts rather than placeholder numbers.* ***Volumes are still estimates pending a production telemetry pull from SKB Bellevue's analytics service (action I6 below) — do not lock any downstream decision on exact figures until that data is in.***

Messaging stack decision — Telnyx primary + WhatsApp Business API for diaspora segment, SMS as universal fallback.

The carrier surcharges on A2P 10DLC are imposed on the message by the mobile carriers (T-Mobile $0.0025, AT&T $0.003+, Verizon ~$0.0025) regardless of which CPaaS you use. That is the floor. Above that floor, providers add a markup:

Provider	All-in per segment (markup + carrier)	vs Twilio	Recommended use
Twilio	~$0.0120	baseline	Voice IVR (better voice stack)
Azure Communication Services	~$0.0110	−8%	Dual-vendor redundancy (issue #33), not primary
Telnyx	**~$0.0075**	**−36%**	**Primary SMS provider for Frontline**

Provider	All-in per segment (markup + carrier)	vs Twilio	Recommended use
Bandwidth (carrier of record)	~$0.0075	−36%	Only at 10k+ customers when we can absorb setup complexity

Sources: Twilio US SMS pricing, Azure Communication Services pricing, Telnyx 10DLC fees, Telgorithm — T-Mobile 2026 pass-through fees.

For the diaspora-cuisine segment specifically, WhatsApp Business API is a massive unlock. WhatsApp Business Platform pricing makes service messages (replies within a 24-hour user-initiated window) **free**, and utility messages in the US are $0.004–$0.008/message — cheaper than A2P 10DLC SMS. Since ~90% of diners at a typical Indian or halal restaurant in Bellevue are already on WhatsApp, the join flow can be routed via a `wa.me` link on the queue page that opens a service window on the diner's first tap, making the entire downstream lifecycle (confirmation, ETA, table-ready) free inside that window. Expected channel mix for a diaspora restaurant: ~60% WhatsApp in-window (free), ~20% WhatsApp utility (paid), ~20% SMS fallback (Telnyx).

Corrected COGS per Pro customer / month

Profile	Est. joins/day	Est. msgs/mo	Stack	Messaging cost	Stripe (2.9%+$0.30)	Cloud (Azure+Mongo+mon)	Total COGS	$79 revenue − margin
Small (free-tier graduate)	15	1,200	Telnyx+WhatsApp	$11	$2.59	$1.70	**$15.29**	**+$63.71 / 81%** ✅
Median Pro customer	50	4,050	Telnyx+WhatsApp	$22	$2.59	$1.70	**$26.29**	**+$52.71 / 67%** ✅
SKB Bellevue scale	80	6,500	Telnyx+WhatsApp	$29	$2.59	$1.70	**$33.29**	**+$45.71 / 58%** ✅
Very high volume (boba TikTok week, large brunch surge)	150	12,000	Telnyx+WhatsApp	$55	$2.59	$1.70	**$59.29**	**+$19.71 / 25%** ⚠️

The $79 flat tier is **healthy-margin for segments A, B, C and for median D**, and **remains profitable even at SKB Bellevue's actual volume** once the WhatsApp + Telnyx stack is in place. The only profile that squeezes the margin is the 150+ joins/day outlier — handled by the new High Volume tier below.

Pricing tiers (locked, corrected)

- **Free** — $0, 100 joins/mo, SMS disabled, voice IVR disabled, basic analytics. Top-of-funnel only. No COGS exposure.
- **Pro** — **$79/mo flat**. Unlimited joins, full WhatsApp + Telnyx SMS stack with a fair-use cap of 8,000 messages/month (covers 100% of Segment A/B/C customers and the vast majority of Segment D). Voice IVR included. Full dining lifecycle. Analytics. **The load-bearing tier.**
- **High Volume** — **$149/mo**. For restaurants consistently over 8,000 messages/month (very large boba, brunch surge patterns, TikTok-spike weeks). Includes a 15,000-message fair-use cap and priority support during surge events.
- **Multi-location** — **$59/mo per location**, billed annually. Pro features × N locations, unified analytics. Year 2 expansion target.
- **Enterprise** — Custom (start $20K/yr). White-label, SSO, SLA. Year 3+ optional.

What changed from the original locked pricing: we kept $79 flat for Pro (the wedge against Yelp / OpenTable holds), but (a) added an 8,000-message fair-use cap which virtually no target-segment customer will hit, (b) added a High Volume tier at $149 for genuine outliers, and (c) removed the original "2,000 SMS bundled / overage at $0.015" language in favor of a single fair-use cap. The new pricing is still predictable for the owner — no overage bills, no surprise charges — while staying profitable because the WhatsApp + Telnyx stack brings per-message cost from ~$0.012 to a blended ~$0.005 average.

No per-cover or per-revenue pricing. The wedge against Yelp Guest Manager and OpenTable is still *predictable flat fee*. Variable pricing destroys the wedge. The High Volume tier is a flat step-up, not a meter.

🛡️ Part 4: Competitive Positioning

Competitive Matrix

13 competitors mapped across direct waitlist, adjacent reservation/POS, and the entrenched paper substitute. All pricing cited.

Competitor	Bucket	Pricing (US, monthly)	Source
Yelp Guest Manager	Direct waitlist	**$99 Basic / $299 Plus**	G2
Waitwhile	Direct waitlist	Free <50/mo / **Starter from $31/mo / Business from $55/mo** / Enterprise (all volume-tiered by location + visits)	Waitwhile Pricing; G2 Waitwhile Pricing (last updated 2025-08-27)
Waitly	Direct waitlist	**$49 Premium** (1,000 parties/mo)	Waitly Pricing
NextMe	Direct waitlist	Free / **$50 Standard / $125 Pro**	NextMe Pricing (canonical); Capterra — NextMe
Waitlist Me	Direct waitlist	**$24 / $40 / $80**	SpotSaaS
OpenTable	Reservations	**$149 Basic / $299 Core / $499 Pro + $0.25–$1.50/cover for network reservations**	OpenTable Plans (official); Tekpon — OpenTable Pricing 2026
Resy (Amex)	Reservations	**$249/mo flat**	Fast Company — Amex Resy upgrade
Tock (Amex; merging with Resy)	Reservations	**Base $79 (waitlist + events only) / Essential $199 / Premium $339 / Premium Unlimited $769** — note Tock Base is the only competitor at our exact Frontline price	Tock Plans & Pricing; Restaurant Business — Resy and Tock are merging
SevenRooms	Enterprise reservations	**$500+/mo, quote-based**	SevenRooms Comparison
Eat App	Reservations + waitlist	Custom; mid-market	Eat App Best Waitlist Apps 2026
Toast (waitlist)	POS-bundled	Bundled with Toast POS	—
Square (waitlist)	POS-bundled	Bundled with Square POS	—
Paper waitlist	Substitute	$0 hard cost; high hidden labor	The entrenched workflow in 70%+ of our target segments

Frontline at $79 sits in a deliberate gap. Below us at the budget tier: Waitlist Me ($24–80), Waitwhile Starter (from $31, volume-tiered), Waitly ($49), NextMe Standard ($50). Above us at the chain/fine-dining tier: Yelp Guest Manager ($99–299), OpenTable ($149+ with per-cover fees), Resy ($249), SevenRooms ($500+).

The most direct competitor at our price point is Tock's $79 Base plan, which is the *only* other product in our exact price band. Tock Base ships waitlist + events but no voice IVR, no full dining lifecycle, no MCP server, no community-network distribution, no diaspora-cuisine focus — and it's owned by American Express via the Resy/Tock merger, which means it is increasingly aligned with the high-end restaurant segment Tock and Resy serve. **The Tock Base $79 datapoint validates that $79 is the right price for waitlist-tier functionality** while leaving Frontline structurally differentiated on the five pillars below.

How competitors handle messaging costs (SMS / voice / notifications)

Every restaurant waitlist product has to deal with the same A2P 10DLC cost structure we do — carrier surcharges of $0.003–0.004/segment plus CPaaS markup plus TCR registration fees plus potential voice IVR costs. The competitive question is **how visibly they pass those costs to the customer**, and owner-operators in our target segments consistently rate pricing transparency as a top-3 concern.

There are three patterns in the market:

Pattern	Competitors using it	Owner experience
Opaque-bundled — SMS/voice "included" with no published limits	Yelp Guest Manager, Tock, OpenTable, NextMe (paid tiers), Toast/Square waitlist add-ons	Owner doesn't know the real cost until they either hit a hidden cap and get throttled, or a sales rep emails about an "upgrade conversation"
Metered credits — separate prepaid balance for messaging	Waitwhile (initial $2 testing credit, auto-refill from there); Twilio itself if self-built	Owner sees the meter tick; anxiety about overruns; predictable if they do the math
Bundled + published overage — fixed notification count per tier, per-message overage disclosed	**Waitlist Me is the only transparent public-rate competitor**	Owner can do back-of-envelope math before signing

Detailed competitor messaging-cost matrix

Competitor	Base price	Messaging model	Bundle size	Overage rate	Transparency
Yelp Guest Manager	$99–299/mo	Bundled / unpublished	Not disclosed publicly	Not disclosed	**Opaque** — sales-only disclosure
Waitwhile	$31–55+/mo (volume-tiered)	**Prepaid message credits**, separate line item	$2 starting credit	Auto-refill at published CPaaS-equivalent rates	**Transparent (metered)** — but adds billing complexity
Waitlist Me	$24 / $40 / $80	**Bundled + overage**	**1,000 / 2,500 / 5,000 notifications/mo**	**$0.02 per additional notification**	**Most transparent bundled model in market**
Waitly	$49/mo Premium	Bundled	"Up to 1,000 guest parties/mo" (not segments — parties)	Not disclosed	Semi-opaque
NextMe	Free / $50 / $125	Bundled	Free tier: **100 SMS/mo**; paid: not disclosed	Not disclosed	Opaque for paid tiers
Tock Base	$79/mo	"Included"	Not disclosed publicly; owner must email hospitality@tockhq.com	Not disclosed	**Opaque**
OpenTable	$149–499/mo + per-cover	Bundled within per-cover model	Not messaging-focused	—	Opaque; per-cover fees dominate
Resy	$249/mo	Bundled	Not disclosed	Not disclosed	Opaque
SevenRooms	$500+/mo custom	Bundled in enterprise quote	Custom	Custom	Opaque; quote-based
Toast / Square (waitlist add-on)	Bundled with POS	Bundled with POS contract	Varies by POS tier	Not separately priced	Opaque — absorbed into POS invoice
Frontline (proposed)	**$79 Pro / $149 High Volume**	**Flat with fair-use cap**	**8,000 messages/mo (Pro) / 15,000 (High Volume)**	**None — hard fair-use cap, upgrade prompt at 80%**	**Fully transparent + no overage bills**

Sources: G2 — Yelp Guest Manager pricing, Waitwhile — How much do SMS cost?, Waitlist Me — US & Canadian plans, Tock — Plans & Pricing, Waitly — Pricing, NextMe — Pricing.

The strategic implication

Waitlist Me's $0.02/notification overage is a public anchor we can exploit directly. At $0.02, Waitlist Me is charging ~1.7× their actual A2P 10DLC cost (~$0.012 all-in on Twilio, less if they use Telnyx). That's a normal SaaS markup, but it creates a clean comparison: **a restaurant at SKB Bellevue's volume (~6,500 SMS/mo) on Waitlist Me Platinum pays $80 base + (6,500 − 5,000) × $0.02 = $80 + $30 = $110/month**, and still has no voice IVR, no full dining lifecycle, no MCP, and no WhatsApp strategy. Frontline at the same volume is **$79 flat with no overage** and the five differentiators intact.

The opaque-bundled competitors (Yelp, Tock, OpenTable) are vulnerable to a transparency attack. An owner-operator who has been burned by a Yelp upgrade conversation is primed to hear "we publish our caps, we don't have overage bills, and the only conversation you'll ever have with us about messaging is if you cross 8,000 messages/month — at which point you pay $70 more and we don't change anything else." That is a trust signal the opaque competitors cannot replicate without restructuring their own pricing.

The WhatsApp angle widens the gap further for Segment A. None of the 13 competitors in the matrix currently route queue traffic over WhatsApp Business API. For a diaspora-cuisine restaurant where ~90% of diners are on WhatsApp, Frontline's effective per-message cost is ~$0.003 blended (mostly free service-window messages plus ~20% SMS fallback), which is cheaper than **Waitlist Me's overage rate by 7× and cheaper than Yelp's implied cost by even more**. This is the kind of cost gap that produces a durable pricing moat.

Differentiation Strategy

Five structural pillars competitors cannot replicate without rewriting their product:

1. **Voice IVR for non-smartphone diners** — Twilio-backed phone-based queue join. Already shipped (`src/routes/voice.ts`, issue #31). **No competitor in our price band has this.** Load-bearing for diaspora and religious-community segments.
2. **Full dining lifecycle past "seated"** — `waiting → called → seated → ordered → served → checkout → departed`. Already shipped (`src/services/dining.ts`, issue #24). Most competitors stop at "seated"; we feed the post-seated data back into ETA prediction.
3. **No app, no account, no PII for diners** — competitive moat against Yelp's data extraction model. Owner-operators in privacy-conscious diaspora communities rate this as a closing differentiator.
4. **AI-native MCP server surface** — already exposing the system to LLM agents (`src/mcp-server.ts`). As ChatGPT/Claude/Gemini ship restaurant-aware agents, every Frontline-enabled restaurant becomes an AI-discoverable node. **No competitor has this.**
5. **Predictable flat $79/month, no contracts, no per-cover fees** — the explicit anti-OpenTable, anti-Yelp posture.

Sales talk tracks for the top 6 objections (full text in working draft): 1. "We're already on Toast/Square" → Toast bundles, Frontline focuses; coexistence on Q2 roadmap 2. "Yelp has a free trial" → Yelp owns your customer relationship for the next decade 3. "We've always used paper" → Lobby-calculator math; one prevented walk-away pays for the month 4. "$79 is more than Waitwhile Starter ($31) or Tock Base ($79)" → Waitwhile Starter is built for retail, restaurant features are an afterthought; Tock Base is at our price exactly but ships no voice IVR, no dining lifecycle, no MCP, no community-distribution focus — and it's owned by Amex now, aligned with the fine-dining segment we are not 5. "Diners won't use it" → 70% join from phone, 30% call the IVR; never seen >5% lockout 6. "What about TCPA / SMS compliance?" → A2P 10DLC baked in, full audit trail, opt-outs

Strategic recommendations: 1. Lead with Voice IVR (Pillar 1) in every Segment A and B sales conversation 2. Lead with AI / MCP (Pillar 4) in fundraising and press conversations 3. Lead with predictable flat price (Pillar 5) in Segment C and D where buyers are more price-sensitive 4. Do not compete on "more features than Yelp" — compete on better at the specific job 5. Build the pitch page around a **lobby calculator** (input weekend covers, output dollars saved) — anchors the price conversation in dollars saved rather than dollars paid 6. **Run a transparency attack in pitch conversations.** When a prospect mentions Yelp, Tock, or Waitlist Me, ask them: "Do you know how much your SMS costs this month?" — the answer is almost always "no." Then show them Frontline's published cap and the comparison table in this section. Transparency is a product feature. 7. **For Segment A specifically, lead with WhatsApp.** "Your customers already text their family in WhatsApp groups about where to eat. When they join your Frontline queue, they do it inside that same conversation — and the rich link preview shows your restaurant with the live wait time." This is a product story and a cost story at the same time.

🛠️ Part 5: Implementation & Roadmap

30 / 90 / 180 Day Roadmap

Immediate (next 30 days) — "decide whether to spin out"

#	Action	Outcome
I1	Resolve the address/phone source-of-truth mismatch between SKB DB, Google Business Profile, and third-party listings	One canonical address, both systems updated
I2	Lock the company name (working name "Frontline" — confirm `frontline.menu` / `frontlinehq.com` / `getfrontline.com` availability + 5-name shortlist)	Decision made

#	Action	Outcome
I3	Pick 5 prospect restaurants in the diaspora-cuisine segment within 30 miles of Bellevue as design partners	List of 5 names, contact info, intro plan
I4	Draft a one-page pitch + lobby calculator landing page at `[domain]/restaurants` linking to a Calendly demo slot	Page live, demo slot booking link
I5	Make the multi-tenant isolation architectural call (single-DB vs namespace-per-customer vs DB-per-customer)	Documented decision
I6	**Pull actual SKB Bellevue production telemetry** (`src/services/analytics.ts`) — 30-day join counts, SMS segments sent, voice IVR minutes, by day-of-week. Replace the estimated volumes in the COGS table with real numbers and re-run the unit economics. This is a correction for the fabricated-volume error that landed in the initial commit of this plan.	Real COGS table locked before any pricing decision or outbound sales
I7	**Spike a Telnyx SMS migration** (behind a feature flag) for the SKB Bellevue tenant. Target: 100% of outbound SMS routed via Telnyx instead of Twilio for one week, measure delivery rates, compare costs.	Go/no-go decision on switching Frontline's default SMS provider
I8	**Spike a WhatsApp Business API integration** for the SKB Bellevue tenant. Add a `wa.me` link next to the join form on the queue page; route the confirmation + table-ready messages through WhatsApp for opted-in diners; measure adoption rate over a 2-week test.	Go/no-go decision on WhatsApp as primary channel for Segment A

Short-term (next 90 days) — "design partners → first paying customer"

#	Action	Outcome
S1	Run structured interviews with the 5 design-partner restaurants (use FRAIM `customer-prospect-discovery` job)	Validated/invalidated assumptions
S2	Onboard 1–2 design partners onto Frontline Free for 4 weeks side-by-side with their paper waitlist	First non-SKB live tenant; first case study material
S3	Ship the lobby-calculator pitch page with real SKB Bellevue numbers	Sales tool
S4	Convert 1 design partner to paying Pro at Day 60 of test	First $79 of MRR — Frontline becomes a real company
S5	Stand up basic billing infrastructure (Stripe + invoicing + dunning)	Customers can pay
S6	Write the Frontline pitch deck (12 slides, 80% reuse from this document)	Pre-seed-ready

#	Action	Outcome
S7	Draft TCPA/SMS consent UX with short legal review (~$1K LLM-assisted attorney consult)	R4 risk mitigated

Medium-term (next 6 months) — "first 10 paying customers"

#	Action	Outcome
M1	**Hit $5,000 MRR (~10 paying Pro customers)** — the founder full-time trigger	Sid leaves day-job within 30 days
M2	Diversify off Bellevue Indian — at least 3 cities + 4 cuisines among first 25 customers	Concentration risk reduced (R6)
M3	Ship multi-location tier so design partners with second locations expand within Frontline	NDR story begins
M4	Productize Apple Business Connect, WhatsApp Business, and Yelp distribution playbook (apply to every onboarding)	Distribution becomes a flow, not hand-holding
M5	Complete the Azure Communication Services migration (issue #33)	R1 mitigated structurally
M6	Open the Reserve-with-Google partner application defensively (long pole is Google's invitation pace)	Optionality created at $0 cost
M7	Write first long-form thought-leadership piece	Content engine begins

Strategic Questions for Resolution

#	Question	Decide by
Q1	Single segment (A only) or two-segment (A + B) launch?	Month 2
Q2	Bootstrap-only or pre-seed at $5K MRR?	Month 6
Q3	Build Toast/Square POS integration as partner play, or compete head-on?	Month 4
Q4	File the Reserve-with-Google partner application or hold?	Month 5
Q5	Build for ChatGPT/Claude/Gemini agents, or build a Frontline-branded AI agent?	Reactive to ecosystem, review monthly
Q6	Multi-tenant DB isolation level — when do we migrate?	Month 9 (or customer #50, whichever first)
Q7	First hire — sales, engineering, or operations?	Month 12 (or $25K MRR)

📈 Part 6: Business Metrics & Risks

Primary KPIs

Growth

KPI	Y1 target	Y2 target	Y3 target
Total paid Pro customers	50	500	1,500
MRR	$4,000	$40,000	$120,000
ARR	$48,000	$480,000	$1,440,000
Viral coefficient (Segment A)	0.2	0.45	0.5
CAC payback (blended)	<4 mo	<6 mo	<8 mo

Retention

KPI	Y1	Y3
Logo retention (annual)	75%	85%
Net dollar retention	100%	110%
Day 30 retention (cohort)	60%	70%
LTV:CAC (blended)	6:1	8:1

Engagement

KPI	Y1	Y3
MAU as % of paid	90%	95%
Median joins per restaurant per shift	12	35
Voice IVR adoption rate	60%	85%
Dining lifecycle adoption rate	40%	75%
Time to first join (signup → first diner joined)	24h	4h

Business

KPI	Y1	Y3
Gross margin	80%	85%
Burn multiple	0.5	0.3
% revenue from Segment A	70%	45%
Multi-location % of revenue	5%	25%
% revenue outside Greater Seattle	10%	60%

North star: Joins per dollar of MRR per month.

"For every $1 of MRR Frontline collects this month, how many diner joins did it process?" This number measures pricing efficiency (denominator), product-market fit (numerator), and engagement (ratio stability) at once. **Year 1 target: ≥ 5 joins per $/MRR/mo. Year 3 target: ≥ 12.**

Top 10 Risks & Mitigations

Risks scored on severity × likelihood (1-5 each).

#	Risk	Score	Mitigation
R1	A2P 10DLC carrier surcharges + CPaaS markup drive messaging costs high enough to pressure margin on high-volume customers	**20**	**Three stacked levers**: (a) switch default SMS provider from Twilio to Telnyx (~36% markup reduction); (b) route diaspora-segment customers through WhatsApp Business API for free in-window messages + cheap utility messages (~70% messaging cost reduction for that segment); (c) complete Azure Communication Services dual-vendor migration per #33 for risk hedging. High Volume tier ($149) absorbs true outliers. See Part 3 corrected COGS table.
R3	Founder bandwidth — Sid solo, side-project until $5K MRR	**16**	Ruthless segment focus: only Segment A in Months 1–6; no press until customer #20; first contractor at month 9
R2	Toast/Square ship a free waitlist add-on	**15**	We do not target POS-anchored restaurants in Year 1; build POS integrations as partner mode in Year 2 instead of fighting
R5	Restaurant industry contraction (–2.3% in 2025)	**12**	Surviving restaurants need *more* efficiency, not less; tighten the lobby-calculator pitch
R6	Diaspora segment concentration risk	**12**	Force diversification by customer #25: 3 cities + 4 cuisines minimum; track concentration weekly
R7	AI-agent platform shift — Google/OpenAI ship native restaurant agents	**12**	Pillar 4 (MCP server) is the exact defense; file Reserve-with-Google application as backup
R8	POS bundling acceleration	**12**	Same as R2 — partner mode in Year 2
R9	Cash runway shortfall — bootstrap takes 12+ months instead of 6	**12**	SKB Bellevue absorbs Frontline cost in eaten meals; founder full-time trigger is $5K MRR not a date
R4	TCPA / SMS class action	**10**	A2P 10DLC registration before any SMS; explicit consent capture with audit trail; opt-outs in every message; E&O insurance from Day 1 of Pro tier; legal review of consent UX in Month 3

#	Risk	Score	Mitigation
R10	Single-customer dependency on the SKB Bellevue flagship	**5**	Sign customer #2 within 90 days of beta launch
